

newton

Employs Newton method to find  $\mathbf{F}(\mathbf{x}) = 0$ , where  $\mathbf{x} \equiv \{\text{geometry}\}$  and  $\mathbf{F}$  is defined in [dforce](#).

[called by: [xspech](#).] [calls: [dforce](#), [packxi](#) and [global:wrtend](#).]

contents

1	newton	1
1.0.1	iterative, reverse communication loop	1
1.0.2	logic, writing/reading from file	1
1.0.1	iterative, reverse communication loop	
1.	The iterative, Newton search to find $\mathbf{x} \equiv \{\text{geometry}\} \equiv \{R_{i,l}, Z_{i,l}\}$ such that $\mathbf{F}(\mathbf{x}) = 0$ , where $\mathbf{F}$ and its derivatives, $\nabla_{\mathbf{x}}\mathbf{F}$ , are calculated by <a href="#">dforce</a> , is provided by either	
i.	NAG: <a href="#">C05NDF</a> if <a href="#">Lfindzero=1</a> , which only uses function values; or	
ii.	NAG: <a href="#">C05PDF</a> if <a href="#">Lfindzero=2</a> , which uses user-provided derivatives.	
2.	The iterative search will terminate when the solution is within <a href="#">c05xtol</a> of the true solution (see NAG documentation).	
3.	The input variable <a href="#">c05factor</a> is provided to determine the initial step bound (see NAG documentation).	
1.0.2	logic, writing/reading from file	
1.	Before proceeding with iterative search, <a href="#">dforce</a> is called to determine the magnitude of the initial force imbalance, and if this is less than <a href="#">forcetol</a> then the iterative search will not be performed.	
2.	As the iterations proceed, <a href="#">global:wrtend</a> will be called to save intermediate information (also see <a href="#">xspech</a> ).	
3.	If the derivative matrix, $\nabla_{\mathbf{x}}\mathbf{F}$ , is required, i.e. if <a href="#">Lfindzero=2</a> , and if <a href="#">LreadGF=.true.</a> then the derivative matrix will initially be read from <a href="#">.ext.sp.DF</a> , if it exists, or from <a href="#">.sp.DF</a> .	
4.	As the iterations proceed, the derivative matrix will be written to <a href="#">.ext.sp.DF</a> .
