## curent

briefly

[called by: mp00ac, dforce.] [calls: coords.]

## contents

1	cui	rent
	1.1	enclosed currents
	1.2	"Fourier integration"

## 1.1 enclosed currents

1. In the vacuum region, the enclosed currents are given by either surface integrals of the current density or line integrals of the magnetic field,

$$\int_{\mathcal{S}} \mathbf{j} \cdot d\mathbf{s} = \int_{\partial \mathcal{S}} \mathbf{B} \cdot d\mathbf{l},\tag{1}$$

and line integrals are usually easier to compute than surface integrals . . .

- 2. The magnetic field is given by the curl of the magnetic vector potential, as described in e.g. bfield.
- 3. The toroidal, plasma current is obtained by taking a "poloidal" loop,  $d\mathbf{l} = \mathbf{e}_{\theta} d\theta$ , on the plasma boundary, where  $B^s = 0$ , to obtain

$$I \equiv \int_0^{2\pi} \mathbf{B} \cdot \mathbf{e}_{\theta} \, d\theta = \int_0^{2\pi} (-\partial_s A_{\zeta} \, \bar{g}_{\theta\theta} + \partial_s A_{\theta} \, \bar{g}_{\theta\zeta}) \, d\theta, \tag{2}$$

where  $\bar{g}_{\mu\nu} \equiv g_{\mu\nu}/\sqrt{g}$ .

4. The poloidal, "linking" current through the torus is obtained by taking a "toroidal" loop,  $d\mathbf{l} = \mathbf{e}_{\zeta} d\zeta$ , on the plasma boundary to obtain

$$G \equiv \int_0^{2\pi} \mathbf{B} \cdot \mathbf{e}_{\zeta} \, d\zeta = \int_0^{2\pi} \left( -\partial_s A_{\zeta} \, \bar{g}_{\theta\zeta} + \partial_s A_{\theta} \, \bar{g}_{\zeta\zeta} \right) \, d\zeta. \tag{3}$$

## 1.2 "Fourier integration"

1. Using  $f \equiv -\partial_s A_\zeta \ \bar{g}_{\theta\theta} + \partial_s A_\theta \ \bar{g}_{\theta\zeta}$ , the integral for the plasma current is

$$I = \sum_{i}' f_i \cos(n_i \zeta) 2\pi, \tag{4}$$

where  $\sum'$  includes only the  $m_i = 0$  harmonics.

2. Using  $g \equiv -\partial_s A_\zeta \ \bar{g}_{\theta\zeta} + \partial_s A_\theta \ \bar{g}_{\zeta\zeta}$ , the integral for the linking current is

$$G = \sum_{i}' g_i \cos(m_i \zeta) 2\pi, \tag{5}$$

where  $\sum'$  includes only the  $n_i = 0$  harmonics.

3. The plasma current, Eqn.(4), should be independent of  $\zeta$ , and the linking current, Eqn.(5), should be independent of  $\theta$ . (Perhaps this can be proved analytically; in any case it should be confirmed numerically.)
